Experiment No.9

Aim: Implement Recurrent Neural Network (RNN) / LSTM for time series or text data

1. Dataset Source

The dataset used for this experiment is the Cardiovascular Disease Dataset.

- Source: Kaggle
- Dataset Name: Cardiovascular Disease Dataset (cardio_train.csv)
- The dataset contains real-world patient health data used for predicting heart disease.

2. Dataset Description

The dataset consists of medical records of patients used to predict the presence of cardiovascular disease.

Features:

Feature	Description
age	Age of patient (in days, converted to years)
gender	Gender of patient
height	Height (cm)
weight	Weight (kg)
ap_hi	Systolic blood pressure
ap_lo	Diastolic blood pressure
cholesterol	Cholesterol level
gluc	Glucose level
smoke	Smoking habit
alco	Alcohol consumption
active	Physical activity

cardio	Target variable (1 = disease, 0 = no disease)

Dataset Characteristics:

- Number of records: ~70,000
- Number of features: 11
- Type: Structured tabular dataset
- Problem Type: Binary classification

3. Mathematical Formulation of RNN / LSTM

A Recurrent Neural Network (RNN) processes sequential data by maintaining memory of previous inputs.

RNN Basic Equation:

$$h_t = f(Wx_t + Uh_{t-1} + b)$$

Where:

- x_t = input at time step t
- h_t = hidden state
- W, U = weight matrices
- b = bias

STM (Long Short-Term Memory)

LSTM improves RNN by handling long-term dependencies using gates.

LSTM Gates:

Forget Gate:

$$f_t = \sigma(W_f[h_{t-1}, x_t])$$

Input Gate:

$$i_t = \sigma(W_i[h_{t-1}, x_t])$$

Cell State Update:

$$C_t = f_t \cdot C_{t-1} + i_t \cdot \tilde{C}_t$$

Output Gate:

$$o_t = \sigma(W_o[h_{t-1}, x_t])$$

4. Algorithm Limitations

- Not naturally suited for tabular data
- Requires reshaping data into sequence format
- Computationally expensive
- Training time is higher
- May overfit if not tuned properly

5. **Methodology / Workflow**

The following steps were performed:

1. Load cardiovascular dataset
2. Data preprocessing and cleaning
3. Feature scaling using StandardScaler
4. Train-test split
5. Reshape data into sequence format for LSTM
6. Build LSTM model
7. Train model using epochs
8. Evaluate model performance
9. Visualize results

Workflow Diagram:

Dataset → Preprocessing → Scaling → Reshaping
→ LSTM Model → Training → Evaluation → Visualization

6. **Performance Analysis**

The model performance was evaluated using:

- Accuracy
- Confusion Matrix
- Classification Report
- ROC Curve

Observations:

- The LSTM model achieved good classification accuracy
- ROC curve indicated strong prediction capability
- Confusion matrix showed balanced classification
- Model captured relationships between features

7. **Hyperparameter Tuning**

The following parameters were tuned:

- Number of LSTM units
- Number of layers
- Batch size
- Number of epochs
- Optimizer (Adam)

Impact:

- Improved model accuracy
- Better convergence
- Reduced loss
- Enhanced learning of feature dependencies

Conclusion

The Recurrent Neural Network (RNN) with LSTM architecture was successfully implemented on the cardiovascular dataset. Although LSTM is primarily used for sequential data, it was adapted by reshaping tabular data into sequence format. The model demonstrated good predictive performance and highlighted the ability of deep learning techniques to analyze complex healthcare datasets.
